Make your own animated mascot *free, in about 20 minutes.*

Design a cute character in your browser, give it 23 ready moods, and put it live on your website with one copy-paste prompt. No drawing. No login. You don't write the code yourself.

01 What you'll make
02 The mascot template prompt
03 Build it in the Studio
04 Export: image, file or demo
05 Put it on your website
06 Make it react to visitors
07 Run it on your laptop + fixes
08 Good to know

6 COPY-PASTE PROMPTS INSIDE

The Studio in this guide is **Bible Strong Avatar Lab**, a free, open-source project by Stéphane Montlouis-Calixte (@_smontlouis). This is my step-by-step walkthrough of it. I'm not part of the project.

01 / what you'll make

A little character that lives on your website.

Bible Strong Avatar Lab is a free studio that runs in your browser. You pick a body shape, place the eyes and choose colours. The Studio does the animation: blinking, breathing and 23 moods, from ***sleeping*** to ***celebrate***. Then you export it as a picture, or as one small file any website can play.

₹0
free, no login

10
starter characters

23
ready animations

3
ways to use it

PATH A · 10 MIN

Just a picture

A PNG for posts, your profile picture, stickers or thumbnails. Needs only a browser.

PAGES 3–5

PATH B · 20 MIN

Live on your website

It moves, blinks and reacts to visitors. Needs a browser and an AI coding tool.

PAGES 3–7

PATH C · OPTIONAL

Your own Studio

Run the Studio on your laptop and change anything in it. For the curious.

PAGE 8

WHAT YOU NEED	WHY	PATH
Laptop + Chrome	The Studio runs in the browser. A phone screen is too small to edit comfortably.	A B C
ChatGPT or Claude	To plan your mascot with the template prompt on the next page.	A B C
Node.js 22.12 or newer	Runs website projects on your laptop. Free from nodejs.org (choose the LTS version).	B C
An AI coding tool	Claude Code, Cursor or similar. It writes the code. You paste the prompts.	B C
Your website's code	The project you want the mascot on. No website yet? Use the ready React demo on page 5.	B

?

How to use the prompts

Every dark box in this guide is a prompt. Copy it, paste it into your AI, and replace the parts in `[lime brackets]` with your own details. That's it.

02 / the mascot template

Plan it first. Two minutes.

Most people open the editor and start dragging sliders. Ten minutes later they have a random blob. Paste this into ChatGPT or Claude first. You get a one-page **mascot card** that tells you exactly what to set in the Studio.

PROMPT 1 · MASCOT TEMPLATE — PASTE INTO CHATGPT OR CLAUDE

```
You are a character designer. Help me design a simple mascot that I will build in Bible Strong
Avatar Lab (avatars.bible-strong.app).

About me:
- My brand or page: [your brand or Instagram name]
- What I do: [one line, e.g. I teach cooking in Hindi]
- My audience: [who watches or buys from you]
- Brand colours: [hex codes, or "suggest some"]
- Vibe in 3 words: [e.g. friendly, smart, calm]

How the Studio works (only use these options):
- Bodies are simple 3D-looking shapes. Starters I can copy: Strobi (round ball), Freddy (block with
ears), Citrus (drop), Nova (bean), Grok bot (black ball), Sunee (sun with dots), Kirby (puffy),
Cloudee (cloud), Cubee (soft cube), Onee (soft blob).
- I can change size, roundness, rotation, body colour, eye colour, and each eye's width, height,
position, spacing and tilt. I can add extra simple shapes, like ears.
- Faces have eyes only, no mouth. Personality comes from shape, colour and eyes.
- Ready animations: sleeping, waking, idle, listening, thinking, searching, working, excited, bored,
suspicious, angry, drowsy, happy, curious, confused, surprised, proud, shy, sad, laughing, scared,
playful, celebrate.

Give me a MASCOT CARD with:
1. A name that is easy to say, and a one-line personality
2. Which starter to copy, and why
3. Body: shape changes, body colour (hex), eye colour (hex)
4. Eyes in plain words (size, spacing, tilt)
5. 5 animations from the list, and the moment each one plays on my website or in my videos
6. 3 places to use the mascot
7. A checklist for the Studio tabs: Pose, Expressions, Animations, Export

Keep it short and simple.
```

EXAMPLE CARD (SHORTENED)

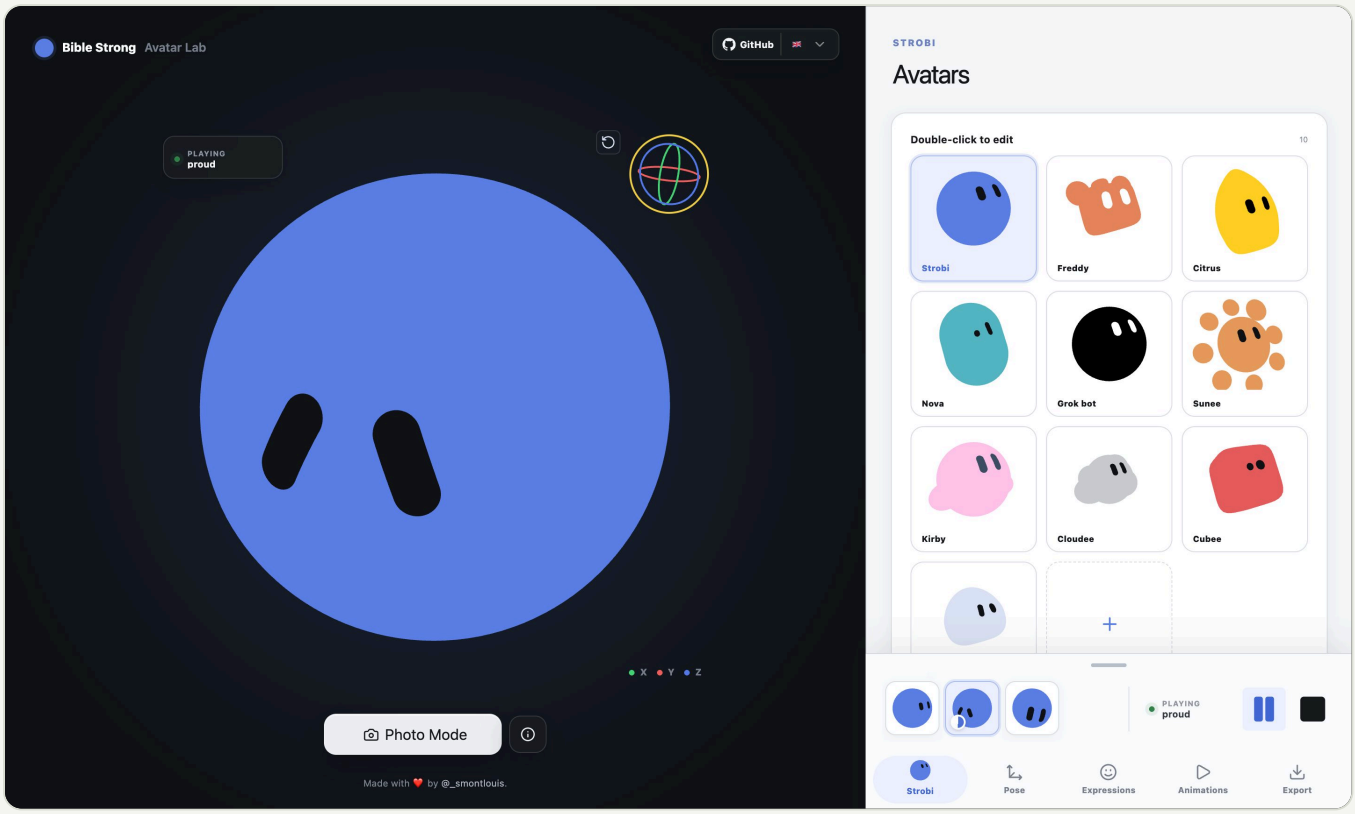

Limo, a calm little helper who gets very excited about your wins. **Starter:** Strobi, because a ball reads friendly. **Body** lime #A8F25A, **eyes** #0B1506, big and close together. **Plays:** ***waking*** on page load, ***excited*** on button hover, ***celebrate*** after a signup.

Why plan first?

The card gives you exact numbers, so you set things once instead of guessing. You also know which animations to keep when you export, so the file stays small.

Build it in the Studio

Open avatars.bible-strong.app on your laptop. No sign-up. Your work saves in your browser automatically.

The Studio. Your character on the left. On the right, the avatar grid. The bottom bar holds the 5 tabs: your avatar, Pose, Expressions, Animations, Export.

1 **Pick your starter**

In the avatar grid, find the starter from your mascot card. Double-click it to edit, or tap **+** to start a new one.

2 **Shape and colour**

Double-clicking opens the avatar editor; changes there are permanent. Set body colour, size and roundness from your card. Drag the character on the canvas to move or rotate it. Any label marked ↔ can be dragged left or right to change its number. (The **Pose** tab is only for trying a temporary pose.)

3 **Eyes do most of the acting**

Set width, height, spacing and tilt for each eye. Close-together eyes look cute. Tilted-in eyes look cheeky. Spend most of your time here.

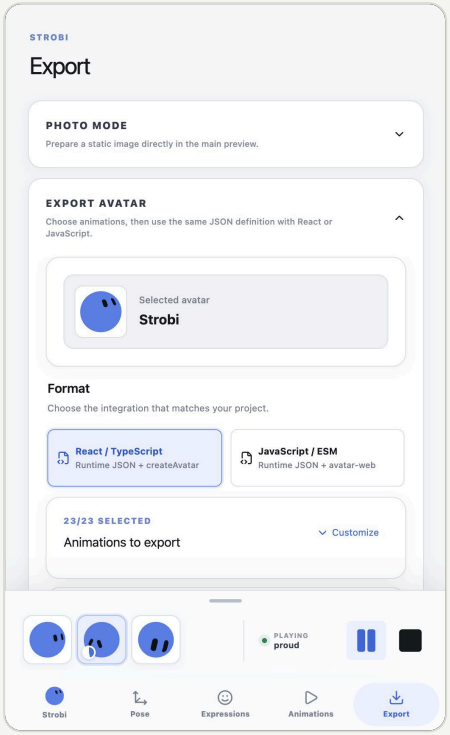

4 **Expressions and animations**

Expressions has 27 ready presets: double-click one to tweak it, or save your own. **Animations** has 23 ready ones. To make a new one, put expressions on a timeline, set how long each one holds, and choose loop, play once or ping-pong. Blinking is automatic.

! **Back it up**

Your work lives only in this browser. Clearing your history or switching laptops loses it. Go to **Export → Studio project** and save a backup file.

Export: a picture, a file or a ready demo

The Export tab. Choose a format, pick animations, download.

Before you download, choose a **Format**: ***React / TypeScript*** for React or Next.js sites, ***JavaScript / ESM*** for anything else. Under **Animations to export**, tap **Customize** and keep only the ones on your mascot card. Fewer animations means a smaller file.

YOU WANT	CLICK	YOU GET
A picture for posts	Photo Mode → Take a picture	PNG or SVG. Transparent, solid or gradient background, in the size you pick.
The mascot on your site	Download .avatar.json definition	One small file with your mascot and its animations. Used on pages 6–7.
A working site, fast	Download React demo (.zip)	A ready project with your mascot in it.
AI does the setup	Copy instruction for AI	Setup steps to paste into your AI coding tool.
A backup	Studio project	Every avatar, expression and animation, to restore in any browser.

No website yet? Run the React demo

Unzip it, open the folder in your terminal, and run two commands. Then open the link it prints, usually `localhost:5173`.

```
# inside the unzipped folder
npm install
npm run dev
```

Never used a terminal? Let your AI coding tool do it:

PROMPT 2 · RUN MY DEMO — PASTE INTO CLAUDE CODE OR CURSOR

```
I downloaded a React demo of my mascot from avatars.bible-strong.app and unzipped it here: [path to the folder].
Install it, start it, and give me the local link to open.
If anything fails, fix it and tell me what was wrong in one simple line.
```

Path A done?

Post your mascot and tag **@saksham.700x**. I share the best ones.

PATH B → NEXT PAGE

Put it on your website

Copy your `.avatar.json` file into your website project. Then paste **one** of these prompts into your AI coding tool. Pick the one that matches your site.

PROMPT 3 · REACT OR NEXT.JS SITE — CLAUDE CODE OR CURSOR

```
Add my animated mascot to this website.

- My mascot file: [avatar.avatar.json], which I put in [src/]
- Package: @bible-strong/avatar-react (on npm). Docs: github.com/smontlouis/bible-strong-avatar-lab
- Use createAvatar(definition) and import '@bible-strong/avatar-react/styles.css' once.

What I want:
1. Show the mascot in the [bottom-right corner] of [every page], [120] px wide.
2. Start with the animation "[idle]". Read my JSON first and list the animation names it has.
3. If this is a Next.js site, put the mascot in a client component.
4. If the visitor prefers reduced motion, show a still expression instead.
5. On phones, it must not cover any button.

Then tell me the command to run the site and what I should see.
```

PROMPT 4 · ANY OTHER SITE (HTML, VITE, ASTRO...) — CLAUDE CODE OR CURSOR

```
My website is not React. It is [plain HTML / Vite / Astro / other].
Add my animated mascot with the npm package @bible-strong/avatar-web.

- My mascot file: [avatar.avatar.json]
- Use createAvatar('#mascot', { definition, defaultAnimation: '[idle]' })
- If my site has no build tool, load the ESM build from a CDN with an import map, and fetch the JSON
before calling createAvatar.
- Put it in the [bottom-right corner], [120] px wide, and keep it off buttons on phones.

Tell me which files you changed and why.
```

WHAT THE AI WILL WRITE (REACT, SIMPLIFIED)

```
npm install @bible-strong/avatar-react react react-dom

import { createAvatar } from '@bible-strong/avatar-react'
import '@bible-strong/avatar-react/styles.css'
import definition from './avatar.avatar.json'

const Mascot = createAvatar(definition)
export const App = () => <Mascot defaultAnimation="idle" size={120} />
```

Make it react to your visitors

A mascot that only loops is a sticker. One that reacts feels alive. Your code can tell it to play any animation at any moment. Here are good moments to start with:

WHEN THIS HAPPENS	PLAY THIS
The page opens	`waking → idle`
Visitor hovers your main button	`excited`
A form is sent, or an order is placed	`celebrate`
A form has an error	`confused`
Something is loading	`thinking · working`
No activity for 30 seconds	`drowsy → sleeping`
Visitor clicks the mascot	`laughing · playful`

PROMPT 5 · MAKE IT REACT — CLAUDE CODE OR CURSOR

```
Make my mascot react to visitors. It already shows on my site with @bible-strong/avatar-react (or
avatar-web).

Use its controller: play(animation), pause(), stop(), setExpression(expression), getState(), and the
onAnimationEnd callback. Only use animation names that exist in my .avatar.json.

Reactions:
- Page opens: play "waking", then switch to "idle" when it ends (or after 2 seconds if it loops)
- Hover on [my main button]: "excited"
- [My signup form] sent: "celebrate"
- Form error: "confused"
- No mouse, scroll or typing for 30 seconds: "drowsy", then "sleeping". Any movement wakes it up.
- Click on the mascot: "laughing"

Rules: no layout jumps, use tap instead of hover on phones, and turn reactions off if the visitor
prefers reduced motion. Show me the code and a short list of what triggers what.
```

Level up: give it a voice

Ask your AI: “Add a small speech bubble next to the mascot that shows one short, friendly tip for each section the visitor scrolls to.” Now it’s a guide, not just a decoration.

07 / path c + fixes

Optional: run the Studio on your laptop

Only if you want to change the Studio itself or work offline. The website already does everything in this guide.

PROMPT 6 · SET UP THE STUDIO — CLAUDE CODE

```
Set up this project on my laptop and start it:
https://github.com/smontlouis/bible-strong-avatar-lab

1. Check that I have Node.js 22.12 or newer. If not, tell me how to install it and stop.
2. Clone the repo into [my Projects folder].
3. Install pnpm if it's missing, then run pnpm install.
4. Run pnpm dev and give me the local link (usually http://localhost:5173).
Explain each step in one simple line. Don't change any project files.
```

Prefer typing it yourself? These are the same steps:

```
git clone https://github.com/smontlouis/bible-strong-avatar-lab.git
cd bible-strong-avatar-lab
npm install -g pnpm
pnpm install
pnpm dev
```

If something goes wrong

IF THIS HAPPENS	DO THIS
“pnpm: command not found”	Run `npm install -g pnpm`, then try again.
Node version error	Install Node.js LTS (22.12 or newer) from nodejs.org, then reopen the terminal.
My avatars disappeared	You opened a different browser or cleared your history. Import your Studio project backup.
Mascot doesn’t show	Check that styles.css is imported and the JSON path is right. Still stuck? Use the prompt below.
“Unknown animation” error	Use a name that’s in your JSON, or export again with that animation selected.
Mascot covers buttons on phones	Ask your AI: “make the mascot smaller on screens under 480 px”.

FIX-IT PROMPT · WHEN ANYTHING BREAKS — ANY AI TOOL

```
Something broke. Here is the full error:
[paste the error]

I was trying to: [what you were doing]
Explain the cause in one simple line, fix it, then tell me how to check that it works.
```

08 / good to know

- **Credit the maker.** The Studio and its packages are free and open source, by Stéphane Montlouis-Calixte (@_smontlouis). Give the GitHub repo a star.
- **Check the license.** It's AGPL-3.0. Great for learning, personal and open-source projects. Using it in a closed-source or paid product can require you to share your own code. Read the license or ask the author first.
- **Back up often.** Your work lives in your browser. Export → Studio project saves it.
- **Sharp at any size.** The mascot is drawn with code (SVG), not pixels, so it never looks blurry.
- **Keep it light.** Export only the animations you use.

Made a mascot?

Tag me. I'll share the best ones.
